

ABSTRACT

The invention consists of a computer program that operates in a workgroup environment in which a manager is responsible for the activities of employees each of whom have interconnected computer systems. The computer program creates an image of every employee's Windows® 95, 98, NT or 2000 computer screen at selectable intervals and allows retrieval of these images at a later time on another computer in the networked workgroup. In a primitive case, the computer program allows retrieval of these images at a later time on the employee's computer by a manager or other authorized person.
